At **Red Sands** Pain Management we use Ultrasound Guidance to have greater **Precision** of PRP injections for **better** results

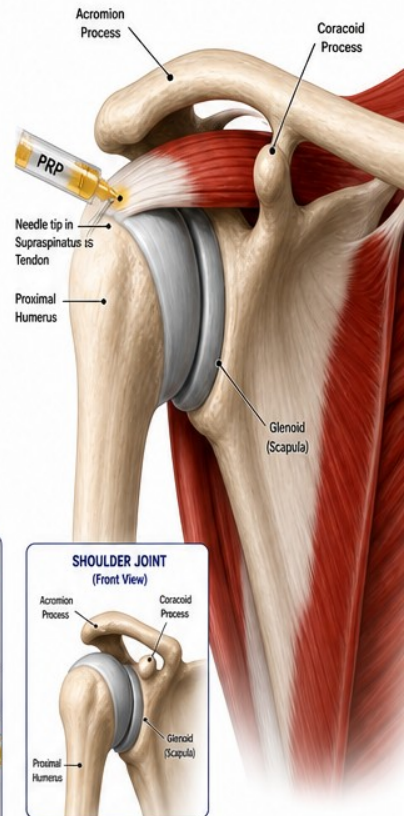

PRP INJECTION FOR ACHILLES TENDINITIS

Platelet-Rich Plasma (PRP) is injected directly into the degenerative area of the Achilles tendon to promote healing and reduce pain.

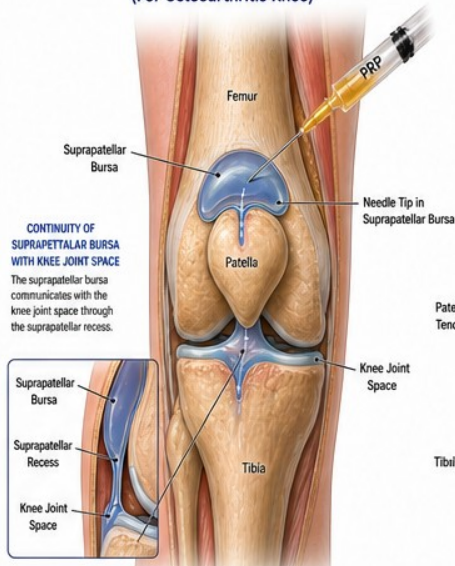

TARGET: The needle tip is placed within the degenerative (tendinopathic) area of the Achilles tendon.
GOAL: Stimulate healing, reduce pain, and improve tendon function.

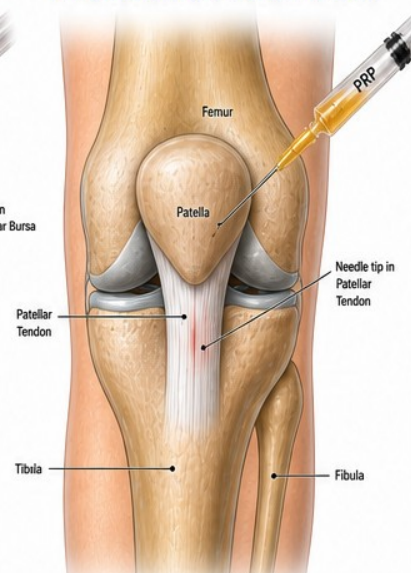

PRP INJECTION IN SHOULDER JOINT (For Supraspinatus Tendonitis)

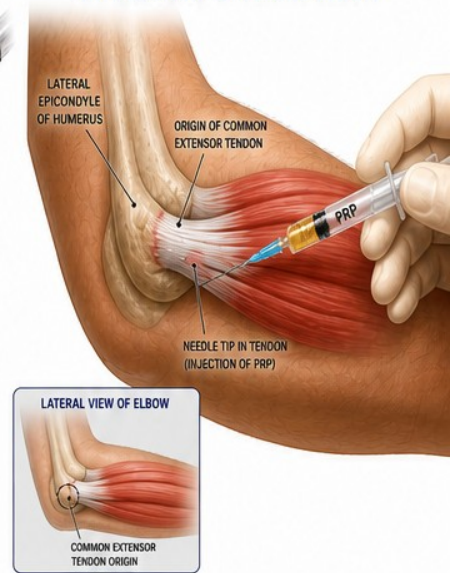

PRP INJECTION IN SUPRAPATELLAR BURSA (For Osteoarthritis Knee)

PRP INJECTION IN PATELLAR TENDON

PRP INJECTION IN TENNIS ELBOW

PRP INJECTION IN SUPRAPATELLAR BURSA

(For Osteoarthritis Knee)

A regenerative approach to reduce pain and improve knee function.

WHAT IS PRP?

Platelet-Rich Plasma (PRP) is injected directly into the degenerative area to promote healing and reduce pain.

AT RED SANDS
PAIN MANAGEMENT
WE USE
**ULTRASOUND
GUIDANCE**
TO INJECT PRP FOR
GREATER PRECISION

GREATER PRECISION. BETTER OUTCOMES.

Real-time imaging helps ensure accurate placement of PRP exactly where it's needed.

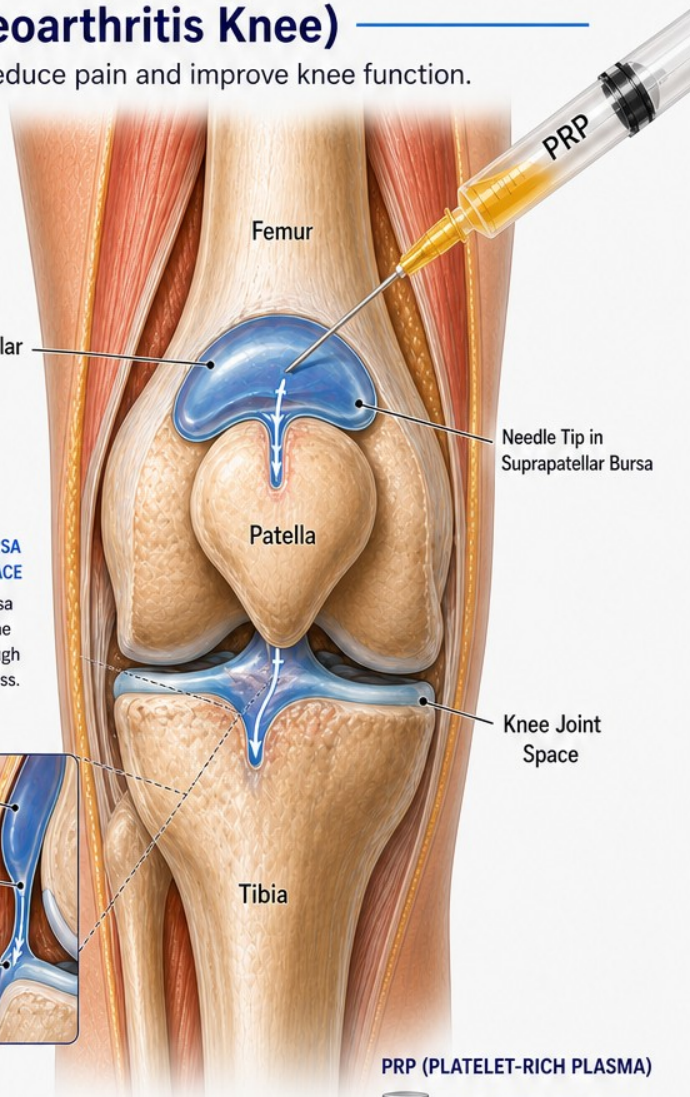

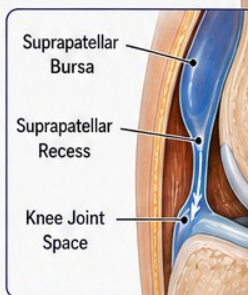

TARGET: The needle tip in the Suprapatellar Bursa allows to spread PRP to the knee joint.

GOAL: Stimulate healing, reduce pain, and improve knee joint function.

CONTINUITY OF SUPRAPATELLAR BURSA WITH KNEE JOINT SPACE

The suprapatellar bursa communicates with the knee joint space through the suprapatellar recess.

PRP (PLATELET-RICH PLASMA)

Platelet Poor Plasma (PPP)
Buffy Coat (Platelets & White Blood Cells)
Red Blood Cells (RBCs)

BENEFITS OF PRP INJECTION FOR KNEE OSTEOARTHRITIS

NATURAL HEALING

Uses your body's own growth factors.

TARGETED RELIEF

Delivered directly to the source of inflammation.

NON-SURGICAL SOLUTION

Avoid surgery and reduce recovery time.

IMPROVE FUNCTION

Helps reduce pain and restore normal movement.

PRECISE PLACEMENT

Real-time imaging ensures accurate injection.

BETTER OUTCOMES

Improved accuracy may enhance healing.

SAFER PROCEDURE

Minimizes risk to surrounding tissues.

PERSONALIZED CARE

Tailored treatment for your specific needs.

PRP INJECTION IN PATELLAR TENDONITIS

HEAL. RELIEVE PAIN. RESTORE FUNCTION.

WHAT IS PRP?

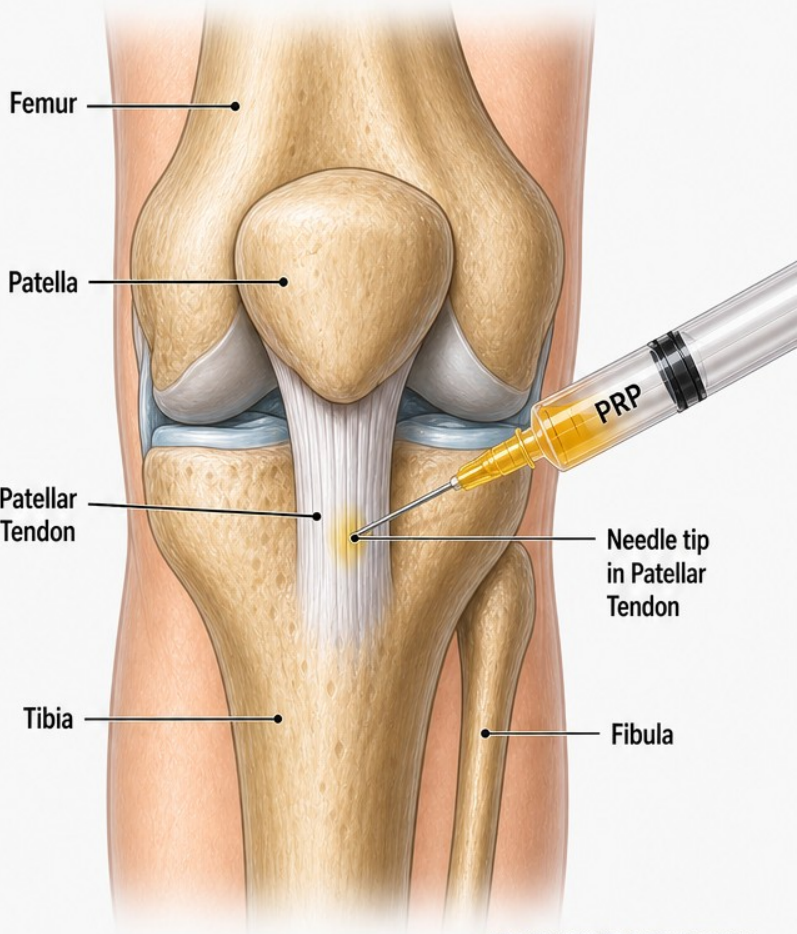

Platelet-Rich Plasma (PRP) is injected directly into the degenerative area of the patellar tendon to promote healing and reduce pain.

PRP FOR TENNIS ELBOW

A NATURAL APPROACH TO HEALING

WHAT IS TENNIS ELBOW?

Tennis elbow (lateral epicondylitis) is caused by overuse and small tears in the tendons that attach the forearm muscles to the outside of the elbow.

Pain and tenderness on the outside of the elbow

Pain with gripping, lifting, or twisting

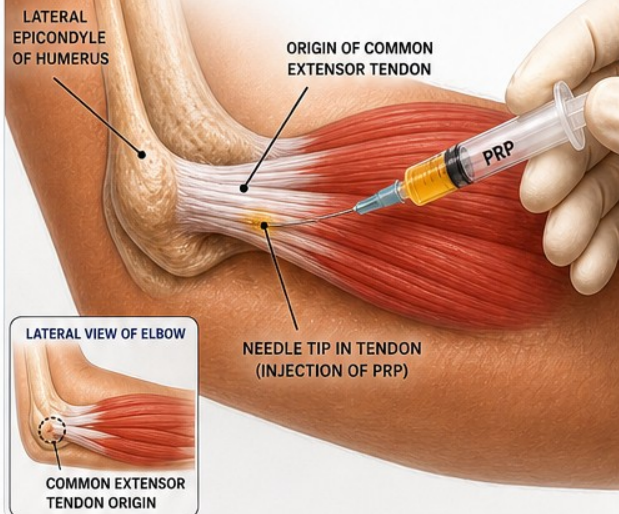

Common in athletes and people with repetitive arm use

HOW PRP HELPS

PRP (Platelet-Rich Plasma) is a concentration of your own platelets, which contain growth factors that help:

- ✓ Reduce inflammation
- ✓ Promote tissue repair
- ✓ Support natural healing

THE PRP PROCESS

1 BLOOD DRAW

A small amount of your blood is drawn.

2 SPIN

The blood is placed in a centrifuge to separate the platelets.

3 EXTRACT PRP

The platelet-rich plasma is extracted.

4 INJECT

PRP is injected into the affected tendon to promote healing.

BENEFITS OF PRP

Uses your body's natural healing power

Minimally invasive outpatient procedure

Short recovery time

Helps reduce pain and improve function

WHAT TO EXPECT

Procedure time: 30–45 minutes

Most patients return to normal activities in 1–2 days

Physical therapy may be recommended for best results

Results improve over several weeks

WHO CAN BENEFIT?

PRP may help people with:

- Chronic tennis elbow (pain lasting > 6 weeks)
- Pain not relieved by rest, medication, or therapy
- Active individuals looking to return to their normal activities

IMPORTANT NOTES

PRP is safe because it uses your own blood.

Results vary. Multiple treatments may be recommended.

Consult with your healthcare provider to see if PRP is right for you.

At Red Sands Pain Management

we use **Ultrasound guidance** to perform this injection for greater precision and better results.

BEFORE & AFTER YOUR PRP

- ✓ Avoid NSAIDs (ibuprofen, naproxen, aspirin) 5–7 days before and after your injection.
- ✓ Use acetaminophen for pain relief if needed.
- ✓ Relative rest for 24–48 hours.
- ✓ Follow your provider's rehab plan.

BEST OUTCOMES WHEN COMBINED WITH

Eccentric loading and strengthening

Guided physical therapy program

Ergonomic modification

TYPICAL RECOVERY TIMELINE

RED SANDS
PAIN MANAGEMENT

Heal. Restore. Get back to what you love.
